How to install Windows (Unofficial guide)

Installing Windows is pretty easy. First, choose the Windows version to install. Note: This is Windows 10 installation guide so the difficulty depends of the version.

When you get Windows ISO downloaded, in file exlorer, move the file to a USB flash drive or a disk with enough space.

When you made the bootable USB, restart your pc and go to BIOS/UEFI and select the disk/USB drive to make it your boot drive.

Exit the UEFI/BIOS and boot your PC. When you see the installation screen, you are soon done.

Follow the setup guide and then when you are in the activation menu, you can get a Windows peoduct key and activate. If you don’t have a key, you can use Windows without activating if you want to.

Restart your PC and go to BIOS/UEFI and make your storage drive you installed Windows on. Make the drive your boot drive.

That is it. You are done.

Hope this helped!
